

## ABSTRACT OF THE DISCLOSURE

A vehicle control apparatus and method drives a driven device with power from a drive power source, and performs a control of stopping the drive power source based on a stop request. The load on the drive power source is reduced by controlling the driven device  
5 so as to reduce the load on the drive power source if the stop request has been output and a system that controls the rotating of the drive power source is in a state where the system is not allowed to stop the drive power source.

1. A vehicle control apparatus and method drives a driven device with power from a drive power source, and performs a control of stopping the drive power source based on a stop request. The load on the drive power source is reduced by controlling the driven device  
5 so as to reduce the load on the drive power source if the stop request has been output and a system that controls the rotating of the drive power source is in a state where the system is not allowed to stop the drive power source.
